

What you will need

- An appropriate photo — Panoramas work best, but regular photos that can be cropped wider than they are tall also work well.
- Unopened metal can or plastic jar
- Glue or Tape
- Scissors
- Measuring Tape or Ruler
- Rubber bands

Instructions

1. Use a tape measure to measure the height and circumference of your can. These will be the approximate dimensions of the image you need to print.
2. Resize your photo to the dimensions you measured earlier. Your image height should match the height of your can, and the length should match the can's circumference or make your image a smidge taller and about a half inch to an inch wider than you measured. Giving yourself extra width is particularly important, as you'll want some overlap to help the glue set properly. The thinner the paper your photo is printed on, the more willing it'll be to conform to the curvature of your can.
3. Once printed, use scissors and ruler to trim your photo to match the height and circumference of your can. Remember to leave yourself at least a half inch of extra width for overlap and a little extra height. (You can always trim away the excess later if you need to.)
4. To affix your photo to your can, you can use any kind of strong glue or tape that will bond paper.
5. Get creative! What other things can be used as frames? Books? Baking Pans? A Frisbee?
